## Testing Methodology

For testing our EECS484 project4 insert, select, and join operators, we wrote .sql files which use every select method and join algorithm. To accomplish this, we analyzed the query optimization algorithms so that we could present queries which explicitly use an unfiltered scan select, a filtered scan select, and index select. We used the same method to create queries which use the INL, SNL and SMJ join algorithms.

In general, we tried to create queries which would visit every code path we wrote.
